

OG Energy Corp. - Climate Change 2023

C0. Introduction

C0.1

(C0.1) Give a general description and introduction to your organization.

OG Energy Corp. (NYSE: OGE), with headquarters in Oklahoma City is an energy and energy services provider and is the parent company of Oklahoma Gas and Electric Company (“OG&E”), a regulated electric utility (together referenced as the “Company”). At December 31, 2022, OGE Energy had 2,237 employees. OG&E serves approximately 889,000 retail electricity customers in Oklahoma and western Arkansas. OG&E, with approximately 7,240 megawatts of generation capacity under financial control and 7,947 megawatts of capacity under operational control, generates electricity from a diverse energy mix, including, natural gas, low-sulfur coal, wind, and solar. Its electric transmission and distribution systems cover an area of 30,000 square miles.

The Company is committed to protecting and responsibly managing the natural resources essential for a cleaner environment, complying with established environmental standards and preserving the quality of life in the communities we serve. The Company is focused on ensuring the necessary mix of generation resources to meet the long-term capacity needs of our customers, with a progressively cleaner generation portfolio. The Company continually monitors, assesses, and strives to improve its environmental performance, and seeks to foster strong working relationships with stakeholders such as customers, investors, communities and the local, state and federal agencies that are impacted by, and monitor, our environmental stewardship. The Company believes it has a dual responsibility to protect our natural resources and to provide safe, reliable and reasonably priced power and will, therefore, bring to any emerging environmental policy discussion the need for a sensible balancing of those responsibilities.

In 2018, the Company set out CO₂ emission reduction expectations for OG&E. Our actions to date reinforce our commitment to reducing our environmental footprint. Sulfur dioxide (SO₂) emissions have decreased by approximately 90%, nitrogen oxide (NO_x) by approximately 80% and carbon dioxide (CO₂) by over 40%, below 2005 levels. As part of our commitment to reducing our environmental footprint, we expect to reduce our CO₂ emissions to 50% below 2005 levels by

2030; and we expect, by 2050, to retire 95% of current fossil-fueled generation, cost-effectively meeting our capacity requirements by replacing retiring generation with newer technology including high efficiency natural gas or zero-emitting technology such as renewables or batteries. In September 2020, OG&E announced its goal to reduce greenhouse gas emissions from vehicle fleets an estimated 60% by 2030.

In October 2020, OG&E completed two 5-megawatt (MW) solar energy farms in southeast Oklahoma to help meet the renewable energy needs of the Chickasaw Nation and the Choctaw Nation (in Davis and Durant, Oklahoma, respectively). During 2021, OG&E added a 5 MW solar farm in Branch, Arkansas and in 2022, expanded its Durant, Oklahoma facility by an additional 5 MW, bringing the total solar capacity to 10 MW at that facility. The new farms, along with the Company's existing Oklahoma solar farms in Mustang and Covington bring total solar capacity to approximately 32 MW since beginning development of solar power installations in 2015.

Except for the historical statements contained herein, the matters discussed in this Questionnaire, including estimated emission reductions, are forward-looking statements that are subject to certain risks, uncertainties and assumptions. Such forward-looking statements are intended to be identified in this document by the words "anticipate," "believe," "estimate," "expect," "intend," "objective," "plan," "possible," "potential," "project," "target," "goal" and similar expressions. Actual emission reductions and environmental or climate impacts may vary materially from those expressed in such forward-looking statements and are subject to a number of factors, including federal or state legislation and regulatory decisions and initiatives; environmental laws, safety laws or other regulations; and the impact on demand for services resulting from cost-competitive advances in technology, such as distributed electricity generation and customer energy efficiency programs and other technological developments.

For more information about the Company, please visit our website at [OG&E - Stewardship Overview \(oge.com\)](#)

C0.2

(C0.2) State the start and end date of the year for which you are reporting data and indicate whether you will be providing emissions data for past reporting years.

Reporting year

Start date

January 1, 2022

End date

December 31, 2022

Indicate if you are providing emissions data for past reporting years

No

C0.3

(C0.3) Select the countries/areas in which you operate.

United States of America

C0.4

(C0.4) Select the currency used for all financial information disclosed throughout your response.

USD

C0.5

(C0.5) Select the option that describes the reporting boundary for which climate-related impacts on your business are being reported. Note that this option should align with your chosen approach for consolidating your GHG inventory.

Operational control

C-EU0.7

(C-EU0.7) Which part of the electric utilities value chain does your organization operate in? Select all that apply.

Row 1

Electric utilities value chain

- Electricity generation
- Transmission
- Distribution

Other divisions

- Smart grids / demand response

C0.8

(C0.8) Does your organization have an ISIN code or another unique identifier (e.g., Ticker, CUSIP, etc.)?

Indicate whether you are able to provide a unique identifier for your organization	Provide your unique identifier
Yes, a Ticker symbol	OGE

C1. Governance

C1.1

(C1.1) Is there board-level oversight of climate-related issues within your organization?

Yes

C1.1a

(C1.1a) Identify the position(s) (do not include any names) of the individual(s) on the board with responsibility for climate-related issues.

Position of individual or committee	Responsibilities for climate-related issues
Board Chair	<p>The CEO serves as the Board Chair; this position provides oversight over the company’s climate risks and opportunities. This position also works in conjunction with the review and monitoring functions delegated to applicable standing committees of the Board in specified areas. The Board receives reports from supporting committees such as the Nominating, Corporate Governance and Stewardship Committee (NCGSC) on corporate stewardship and corporate responsibility programs, policies, and initiatives, including climate, diversity, sustainability, and other ESG matters. The Board Chair leads climate-focused discussions on the company’s strategy, including long-term plans, and risk, including major risk exposures and steps taken to monitor and manage exposures. As a member of the Board, he approves recommendations made by the committees regarding the Company’s environmental initiatives and compliance strategies, including those related to climate, as well as its plans to address various contingent events that could significantly affect the Company, including extreme weather events and natural disasters. An example of climate-related decisions made with the approval of the Board Chair includes the Company’s decision to become a pure-play electric utility through its support of the merger of Enable Midstream and Energy Transfer and the ongoing divestment of Energy Transfer units which was announced in December 2021 and the sale of Energy Transfer units which were completed in 2022. Additionally, the Board Chair also approved the Company’s investment of up to \$50MM in Energy Impact Partners – a private equity firm advancing clean energy technologies in the net-zero carbon future including EIP’s Deep Decarbonization Frontier Fund which was created in 2021 targeting early-stage technologies to accelerate decarbonization across the economy.</p>
Board-level committee	<p>The NCGSC, appointed by the Board and comprised of independent directors, has the responsibility to review and report to the full Board regarding the Company’s (1) corporate stewardship and corporate responsibility programs, policies, and initiatives, including climate, diversity, sustainability, and other ESG matters; (2) environmental</p>

	<p>matters including the Company’s environmental initiatives and compliance strategies, which would include physical risks and hazards such as severe weather events (climate-related) and; (3) contingent plans to address various material events that could affect the Company including natural disasters (climate-related). The NCGSC also oversees the Company’s corporate governance, including the Company’s disclosures regarding areas of oversight, shareholder proposals and the Company’s response, including any action the Company takes in response to shareholder proposals related to climate-related issues. The NCGSC reviewed the 2021-22 Corporate Stewardship Report, which included the SASB (Sustainable Accounting Standards Board) Report as well as the TCFD Report (Task Force on Climate-Related Financial Disclosures) including climate scenarios.</p>
--	--

C1.1b

(C1.1b) Provide further details on the board’s oversight of climate-related issues.

Frequency with which climate-related issues are a scheduled agenda item	Governance mechanisms into which climate-related issues are integrated	Please explain
Scheduled – some meetings	<p>Reviewing and guiding annual budgets</p> <p>Overseeing major capital expenditures</p> <p>Reviewing and guiding strategy</p>	<p>The Company’s Board of Directors oversees all aspects of the Company’s businesses, including the strategy as well as the regulatory and operating aspects.</p> <ul style="list-style-type: none"> • Environmental updates, reports and/or presentations are routinely reviewed with the Board of Directors. For example, in 2021, the Board updated the name and charter of the Nominating, Corporate Governance and Stewardship Committee to elaborate for shareholders the climate-related and stewardship responsibilities of the committee. The full board has received multiple presentations from outside experts related to ESG and climate related matters including evolving policy and regulatory frameworks related to climate risk. The board also reviewed the Corporate Stewardship Report, the TCFD and SASB disclosures. • The Board reviews and approves the Company’s annual budget and other major capital expenditures as necessary. • The Board reviews the Company’s strategy annually including composition of our generation

		<p>facilities and transmission assets to address overall generating capacity and carbon reduction efforts, as well as Integrated Resource Plan filed with state regulators.</p> <ul style="list-style-type: none"> • Management reviews with the Board the identification, monitoring and management of proposed or enacted legislation or regulation pertaining to climate-related issues • The Board's Nominating, Corporate Governance and Stewardship Committee reports to the Board its review and oversight regarding the Company's environmental initiatives and compliance strategies and planning for material events that could affect the Company. The NCGSC also reviews and reports to the Board on the Company's corporate stewardship programs, policies and initiatives, including sustainability, climate and other environmental matters.
--	--	---

C1.1d

(C1.1d) Does your organization have at least one board member with competence on climate-related issues?

	Board member(s) have competence on climate-related issues	Criteria used to assess competence of board member(s) on climate-related issues
Row 1	Yes	<p>OGE Energy's Board members reflect a diverse mix of qualifications, skills, and experiences relevant to the Company's business and strategy. OG&E assesses the competence of its board members on climate-related issues through a mix of qualifications, skills, and experiences that these individuals bring to the company's business and strategy The Company's 10 board members have broad industry expertise to oversee strategy, risk management and investments, including climate-related risks and opportunities. A majority of (7 of 10) the Board of Directors have experience in environmental climate-related matters. Board member expertise includes electric utility and large industrial company knowledge, including expertise in regulatory and policy matters related to these sectors, experience with emerging energy technologies, evolving clean energy solutions in industries that rely heavily on energy services, and climate-related market sector transitions.</p>

C1.2

(C1.2) Provide the highest management-level position(s) or committee(s) with responsibility for climate-related issues.

Position or committee

Chief Executive Officer (CEO)

Climate-related responsibilities of this position

Setting climate-related corporate targets

Monitoring progress against climate-related corporate targets

Managing climate-related risks and opportunities

Coverage of responsibilities

Reporting line

Reports to the board directly

Frequency of reporting to the board on climate-related issues via this reporting line

More frequently than quarterly

Please explain

The CEO is the top-level executive authority in the Company and a group of senior executive members report to this position. The CEO directs the leadership to execute the Company's strategy and vision. The CEO has the responsibility for managing risks affecting the Company, including risks related to environmental (weather and climate-related), operations and regulatory. The CEO, along with the executive leadership positions, review and discuss the strategies and principal risks related to or arising out of the generation and delivery of energy, including opportunities and policies that support the Company's long-term strategy.

The Vice President, Utility Operations has the responsibility for operational issues and reports directly to the CEO. The Chief Financial Officer reports to the CEO and responsibilities include investments, capital expenditures and managing the enterprise risk program. The Vice President Public and Regulatory Affairs reports to the CEO and provides overall leadership for the Company with respect to the monitoring of climate-related issues at federal, regional, and state levels via participation in regulatory development (e.g., notice and comment rulemaking processes) and through industry activities. The General Counsel and Chief Compliance Officer reports to the CEO and manages the legal and compliance functions of the Company. The Vice President of Corporate Responsibility and Stewardship

oversees ongoing strategy development and implementation across all environmental, social, and governance areas, including climate-related matters. The Company's Risk Oversight Committee consists primarily of corporate officers (e.g., CFO, VP Utility Operations) and is responsible for the overall development, implementation and enforcement of strategies and policies for all market-risk management activities of the Company. The Risk Oversight Committee's responsibilities include review and assessment of the existing risk exposure and performance of the Company's business units, including climate-related issues. Members of management are participants on the Risk Oversight Committee.

An example of the multifaceted approach taken by the Company's leadership regarding a physical risk in Oklahoma that is climate-related pertains to severe or unusual weather events. Operations address these items in a pro-active, multi-faceted approach that includes storm or severe weather event planning and execution and activities such as grid enhancement and hardening of the system to mitigate the effects of such physical/weather events. These events may also have capital investment, regulatory recovery and environmental implications.

C1.3

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

	Provide incentives for the management of climate-related issues	Comment
Row 1	Yes	

C1.3a

(C1.3a) Provide further details on the incentives provided for the management of climate-related issues (do not include the names of individuals).

Entitled to incentive

Corporate executive team

Type of incentive

Monetary reward

Incentive(s)

Bonus - % of salary

Performance indicator(s)

Progress towards a climate-related target
 Achievement of a climate-related target

Incentive plan(s) this incentive is linked to

Short-Term Incentive Plan

Further details of incentive(s)

Each year, the Short-Term Incentive Plan is reviewed for performance metrics, eligibility and target payout as a percentage of annual base pay and overtime earnings. The final payout can range from 0-150% of the target payout for each performance metric. Each grade level in each structure is assigned a target payout percentage. The Short-Term Incentive Plan payout is approved by the Company Board of Directors after the end of the performance plan period.

Explain how this incentive contributes to the implementation of your organization's climate commitments and/or climate transition plan

The Company's Annual Incentive Plan is dependent entirely on the achievement of performance goals established by the Board's Compensation Committee and are quantified, audited and shared in the Company's proxy statement. The performance goals reflect, among other things, the aim to deliver safe, reliable, resilient and affordable energy to our customers and to promote a sustainable business model. The Company's Customer/Operations targets include a measure of Equivalent Forced Outage Rate, a measure of unscheduled generation outages, which empowers us to better ensure that generation units are operating as planned and, therefore, with greater reliability and helping meet emissions reduction targets. Additionally, the Company also sets customer satisfaction performance targets for both residential and business customers. Customer satisfaction survey questions against which the Company is rated include areas related to environmental stewardship, innovation, and future orientation, as well as elements related to being a good global citizen – all of which the Company considers aligned with climate and meeting its climate-related commitments. Additionally, the Company provides annual incentive compensation based on safety performance based on recordable safety incidents. The safe operation of the Company's generation facilities is critical to efficient operation of our facilities by experienced staff. The company offers annual incentive opportunities based on the same criteria for all its employees.

C2. Risks and opportunities

C2.1

(C2.1) Does your organization have a process for identifying, assessing, and responding to climate-related risks and opportunities?

Yes

C2.1a

(C2.1a) How does your organization define short-, medium- and long-term time horizons?

	From (years)	To (years)	Comment
Short-term	1	5	
Medium-term	5	10	
Long-term	10	30	

C2.1b

(C2.1b) How does your organization define substantive financial or strategic impact on your business?

From a financial perspective, the Company identifies issues that are material in required financial filings to the Securities and Exchange Commission (SEC) and utilizes SEC guidance on reporting material issues such as SEC Staff Accounting Bulletin No. 99 which suggests that a mix of quantitative and qualitative information is necessary to evaluate materiality. The definition of materiality extends to any financial impact that an investor would deem substantive. From an operational or strategic perspective, the Company defines substantive impact based on whether an observed effect is large enough to be meaningful within the context of financial, operational, reputational or safety assessments and can be applied when determining climate-related risks as well.

The Company does not set a single financial threshold per se to define substantive impact. Rather, using our Enterprise Risk Management (ERM) process, we start by identifying key internal and external business risks — those that pose potential material financial and operational risk to the Company. To determine whether a risk will result in substantive impact, the ERM team has a formal process where business units identify and assess risks, including climate-related risks, consistent with our overall enterprise risk framework. As part of the ERM process, each potentially substantive risk is evaluated individually with respect to a variety of criteria including velocity of risk, likelihood, and magnitude of the event. The Company also compares its substantive risks to those of EEI peer investor-owned utilities as well as information provided by a third-party provider regarding key risks in our sector. Any risk that has a likelihood of occurring in the short term (1-3 years) and has the potential to impact the company in a financially material way is considered a risk with substantive financial impact. Financially material is any issue that an investor may deem to be important and is required to be reported in financial filings to the SEC. Risks and opportunities are then prioritized by their financial impact to the Company or qualitative impact scores. Those with the highest impact are prioritized based on the scoring criteria. A review is performed, noting the highest exposed values in each category/profile type. The review includes a discussion of the risk/opportunity tolerance, residual mitigation plans, and cost to mitigate. After the assessment process is complete, the risks and opportunities are reviewed via interactive discussions with the Company's Officers, Senior Management, and the risk owners. Priority risks are assigned to

internal risk owners, typically senior leadership, who are responsible for developing and updating risk management plans.

Description of process

The OGE Energy Board of Directors has oversight responsibility over the Company's risk management processes, environmental policy, and the potential impact of climate change on the Company's strategy. Risk management planning is coordinated with our Internal Audit group for alignment with the Company's annual audit plan. Risk identification, assessment, and management planning are reviewed with senior leadership, the Risk Oversight Committee, and the Board's Audit Committee. The Company's TCFD Report provides details regarding specific climate-related risks evaluated.

The Corporate Risk Oversight Committee is responsible for evaluating short-, medium- and long-term time horizons across upstream suppliers, downstream suppliers, direct operations, and downstream customers for all corporate-level risks including those that are climate-related risks and opportunities. This process is referred to as our annual Enterprise Risk Management Assessment (ERMA) to identify substantive strategic risks, which are potential major risks to corporate profitability and value, including climate-related risks. The ERMA focuses on risks and opportunities that have the potential to significantly impact the Company's value and pursuit of its objectives, including risks related to regulatory outcomes, litigation, climate, weather, reputation or brand value.

OG&E's annual ERMA process, which is managed by the Corporate Risk Management function, is initiated with an assessment by the Company's officers scoring and evaluating the Company's risks based on probability, likelihood, and impact.

Identify: Using our Enterprise Risk Management (ERM) process, we start by identifying key internal and external business risks that pose potential material financial impact and operational risk to the Company. This involves our Corporate Risk Management function reviewing relevant risk types to our business (e.g., emerging regulation, market, reputation) and identifying risks within each category which could potentially be material to us. Key internal stakeholders are also engaged in this process to ensure all relevant risks are identified. The identification and assessment steps develop quantitative data points that provide the opportunity to compare year-over-year changes.

Assess: The ERMA is also provided to Senior Management to score and evaluate the Company's risks. All risks and opportunities are assessed using a consistent risk framework and methodology. Qualitative impacts are scored using consistent criteria and can be related to the degree of impact, the likelihood of occurrence and the velocity with which the risk might develop. Risks and opportunities are then prioritized by their financial and operational impact to the Company or qualitative impact scores. Those with the highest impact are prioritized based on the scoring criteria. A review is performed, noting the highest exposed values in each category/profile type. The review includes a discussion of the risk/opportunity tolerance, residual mitigation plans, and cost to mitigate. The assessment of climate-related risks is also managed by our Risk Management function as part of the overall Enterprise Risk Management process and is initiated with an assessment by the Company's officers scoring and evaluating the Company's risks based on probability, likelihood, and impact. For example, any risk that has a likelihood of occurring in the short term (1-3 years) and has the potential to impact the company in a financially material way is considered as a risk with substantive financial impact.

Additionally, the ERM process includes evaluating the assessment scored by the Company officers with externally identified risks. Edison Electric Institute (EEI) provides survey results from participating peer Investor-Owned Utilities (IOU) around key risks identified. The company also engages a third-party research company for additional information regarding potentially substantive or material risks in our sector. Having risks validated through third-party consultants helps confirm the comprehensiveness of our risk review.

After the assessment process is complete, the risks and opportunities are reviewed via interactive discussions with the Company's Officers and Senior Management and the risk owners.

Respond: Top identified risks are assigned an internal risk owner who is required to

periodically review that risk and update it along with the current risk mitigation plan. Subject matter experts evaluate potential risks/opportunities that could have substantial financial or strategic impacts on the Company.

This evaluation is robust and helps the Company identify risks/opportunities, mitigation strategies and potential financial implications. Recommendations are communicated to the appropriate risk owner and Senior Executives, as necessary. Risk owners provide updates to their risk areas and specific concerns, along with detailed plans on how the risk is being managed, on at least a quarterly basis to the Risk Oversight Committee. Coordination with Internal Audit is then conducted to ensure alignment with the Annual Audit Plan.

C2.2a

(C2.2a) Which risk types are considered in your organization's climate-related risk assessments?

	Relevance & inclusion	Please explain
Current regulation	Relevant, always included	Current regulation is considered in the Company's assessments of climate-related risk because it sets standards to which the Company must adhere and non-compliance can lead to operational costs or reputational impacts. The Biden Administration established a target of 50 to 52 percent reduction in economy-wide net greenhouse gas emissions from 2005 levels by 2030 with full decarbonization of the electric power industry fully by 2035. The Company tracks the development and implementation of climate-related regulation closely. The EPA has initiated regulation under Clean Air Act Sections 111(b) and 111(d) relevant to OG&E and were considered regulation risks in 2022. In September 2022, the US Environmental Protection Agency (EPA) opened a non-rulemaking docket to take public input on the development of revised and expanded greenhouse gas regulations affecting new and existing fossil fuel-fired electric generating units under Clean Air Act section 111. OG&E provided input to the EPA in this docket through trade associations. Subsequently, on May 23, 2023, the EPA proposed rules to reduce emissions of greenhouse gases from fossil fuel-fired electric generating units under Clean Air Act Section 111. The proposal, which is not yet a final regulation, encompasses both Section 111(b) and 111 (d) rulemakings for new units and existing units, respectively.
Emerging regulation	Relevant, always included	Emerging federal or state climate regulation is a risk type considered by OG&E on a continual basis and is identified as a transition risk within our TCFD risk assessment. A dedicated department follows developments in the U.S. Congress, state legislatures and various agencies which could

		<p>seek to control carbon emissions or drive a change in market policy and the resources we use to generate electricity.</p> <p>The forms of such legislation or regulation are various and have evolved over time from those aimed at reducing CO2 emissions directly including cap and trade and tax or fee programs to renewable portfolio standards (RPS) which incentivize the greater deployment of renewable resources to clean energy standards (CES) which incentivize greater utilization of zero-emissions resources.</p> <p>The federal agencies engaged in these initiatives have expanded beyond the U.S. EPA to now include FERC, DOE, and the SEC among others.</p> <p>Fundamentally, the two main components in assessing potential risk are the magnitude and timing of any program’s requirements. OG&E is a member of the Southwest Power Pool (SPP), a 14-state regional transmission organization (RTO) and integrated market (IM). As such, RTO economics also have an impact and as a regulated utility, incurred operational costs are generally passed on to customers.</p> <p>During 2022, 90% of the energy generation (MWh) from OG&E’s owned portfolio and 54% of the energy generation that OG&E purchased from the SPP’s IM, was fossil-fuel based. In the IM, SPP dispatches generation across its 14-state area generally based on economic merit. Any program that directly disadvantages fossil fuel through a tax or fee on emissions or indirectly through market incentives for non-fossil fueled resources, could adversely impact the economics of both the RTO and the Company’s generation resources.</p> <p>The Company’s 2021 IRP includes multiple sensitivities and scenarios as part of its risk analysis. Sensitivities include a CO2 tax sensitivity and various natural gas price forecasts. The IRP also included an “Energy Evolution” scenario modelling coal capacity reduction through accelerated coal unit conversions and retirements within the SPP. Emerging regulations as described above not only have the potential to impact the Company’s operations but future investment decisions as well. As such, the Company’s ERM process, its IRP process and its federal policy groups among others, work together to help manage risks.</p>
Technology	Relevant, always included	Technology is a risk type regularly considered in the Company's assessments of climate-related risk and is identified as a risk within our TCFD risk assessment. The company faces a variety of technology-related risks that could impact our operations, including costs of

		<p>operations, as well as our ability to meet future targets or mandates related to renewable energy and carbon reduction. The Company is highly invested in operational technologies that are critical to the efficient operation of our grid, from fully deployed smart meters and system automation to investments in solar and wind technologies. These operating technologies are highly interdependent and reliant on communications networks and cyber security.</p> <p>An existing and future technology-related risk is the ongoing security of the technology of our grid, as well as the operation of the network and data technologies that support our grid technologies. Investments in intelligent grid devices, smart meters, and automated control systems are enabling a "self-healing" grid that speeds the restoration process by quickly identifying and isolating outages and are a key part of our strategy. Thus, these technologies must remain well integrated, secure and functioning effectively as we become increasingly technology-enabled in our operating technologies.</p> <p>With respect to generation technologies, as the company expands renewables and adopts storage technologies on our grid, as well as integrating consumer distributed energy resources (such as residential solar), the ability to integrate those technologies into our operations and ensure reliability, resilience and security is key. The Company's Grid Innovation and Integration Department helps identify and test new energy and grid technologies and assess the risks of integration of new technologies. The 2021 IRP analyzed the expansion of new technologies including solar, hydrogen-capable combustion turbines and battery technologies. The adoption and expansion of these technologies could create operational risks and additional operating costs if they do not operate as expected.</p>
Legal	Relevant, always included	<p>Legal considerations are a risk type regularly considered in the Company's assessments of climate-related risk and are identified as a risk type within our TCFD risk assessment. Enactment of national, state, and local climate-related legislation, rules, and regulations may create legal requirements for the Company. The potential risks resulting from such requirements are evaluated on an ongoing basis.</p> <p>The Biden Administration's focused efforts aimed at reducing greenhouse gas emissions and addressing climate change issues have the potential to increase risk for the Company. President Biden's Administration has taken a number of actions that adopt policies and affect environmental regulations, including issuance of executive orders that instruct the EPA</p>

		<p>and other executive agencies to review certain rules that affect OG&E with a view to achieving nationwide reductions in greenhouse gas emissions. The Biden Administration has indicated that it will continue to pursue stricter laws, regulations, and enforcement policies; such changes could significantly increase compliance costs and the cost of any remediation that may become necessary.</p> <p>In addition to assessing compliance risk, the Company evaluates physical risks from climate in terms of both acute, event-driven terms and chronic, longer-term shifts in climate patterns. An increased frequency of extreme weather events, including prolonged droughts, rise in temperatures, wildfires, and ice storms, could heighten potential physical risk. The Company includes the considers the magnitude and frequency of extreme weather in its climate-related risk assessment.</p> <p>Additionally, the Company may be subject to financial risks from private party litigation relating to greenhouse gas emissions. Defense costs associated with such litigation can be significant and an adverse outcome could require substantial capital expenditures and could possibly require payment of substantial penalties or damages. Such payments or expenditures could affect results of operations, financial condition, or cash flows if such costs are not recovered through regulated rates.</p>
Market	Relevant, always included	<p>Market impacts are a risk type regularly considered in the Company's assessments of climate-related risk and are identified as a risk type within our TCFD risk assessment. Market impacts may result from newly enacted climate legislation or from changes in fuel prices and solar capital costs, among other things. Risk types might include rendering the Company's assets less competitive in the SPP Integrated Market. In September 2022, the US Environmental Protection Agency (EPA) opened a non-rulemaking docket to take public input on the development of revised and expanded greenhouse gas regulations affecting new and existing fossil fuel-fired electric generating units under Clean Air Act section 111. OG&E provided input to the EPA in this docket through trade associations. If legislation or regulations are passed at the federal or state levels in the future requiring mandatory reductions of CO₂ and other greenhouse gases at OG&E's facilities or that affect the pricing of fuels, this could result in significant additional compliance costs or direct operational costs that would affect OG&E's future financial position, results of operations and cash flows if such costs are not recovered through regulated rates. In addition, should financial markets view climate change and carbon emissions as a financial risk, this could negatively affect our</p>

		ability to access capital markets or cause us to receive less than ideal terms and conditions.
Reputation	Relevant, always included	Reputation is a risk type considered in the Company's assessments of climate-related risk. There are increasing risks for energy companies from shareholders currently invested in fossil-fuel energy companies concerned about the potential effects of climate change who may elect in the future to shift some or all of their investments into entities that emit lower levels of greenhouse gases or into non-energy related sectors. Institutional investors and lenders who provide financing to fossil-fuel energy companies also have become more attentive to sustainable investing and lending practices and some of them may elect not to provide funding for fossil fuel energy companies. To the extent financial markets view climate change and emissions of greenhouse gases as a financial risk, this could negatively affect our ability to access capital markets or cause us to receive less than ideal terms and conditions.
Acute physical	Relevant, always included	Acute physical risks are a risk type considered in the Company's assessments of climate-related risk through our enterprise risk management process and our ongoing operations management. We have also identified this as a risk type within our TCFD risk assessment. To the extent that any climate change adversely affects the national or regional economic health through physical impacts, OG&E may experience adverse financial impacts including reduced revenues or additional operating costs. The Company has long established risk management processes related to acute physical risks. OG&E's service area is considered to be one of the top 5 locations in the US for extreme weather events. As noted in the TCFD, according to FEMA, Oklahoma and Arkansas are geographic areas subject to some of the highest rates of extreme acute and chronic weather events. Examples of acute physical risks that have occurred in OG&E's service area in just the last 5 years include: tornadoes, polar vortex/extreme cold, severe thunderstorms, ice storms, flooding, drought and wildfires. These acute physical risks have impacts on our transmission and distribution grid as well as on our generation facilities. An example of an acute physical event in 2020 was the October ice storm. The ice storm was one of the Company's most severe, with approximately 475,000 unique customer outages, representing 60% of the Company's Oklahoma customers and 54% of circuits. Because the storm arrived earlier in the year than normal, trees had not yet lost their leaves causing the ice to add weight to the branches, creating a much larger event and making it difficult to restore service because of the increased vegetation management required. In 2022, Oklahoma and Arkansas experienced several impactful severe storms that impacted the utility. These included several storm complexes producing 65-75 mph wind gusts in June and

		July and storms producing microburst damaging winds in August. An ice storm also impacted portions of western Arkansas in February 2022 with some areas receiving upwards of a half inch of ice.
Chronic physical	Relevant, always included	Chronic physical risks are considered in the Company's climate-related risk analysis and are identified as a risk type within our TCFD risk assessment. OGE's risk management process has identified long-term weather impacts (chronic physical risks) as a key risk, especially given the location of our service territory and the prevalence and frequency of extreme weather events therein. OG&E operations will be adversely affected by frequent changes in precipitation patterns and increased mean temperatures. Unpredictable variations in temperatures and precipitation will make it difficult to predict the energy demand and create difficulty in making long-term planning and operating decisions. This risk may impact our investment decisions. Changes in weather patterns in our area could have significant impacts on our ability to serve our load and adversely impact the cost of providing service to our customers, as well as the investments required to maintain grid resilience. For example, weather pattern changes could lead to increased frequency of ice storms, tornadoes, and extreme variations in weather such as the Company has experienced in the last few years (e.g., the Oct. 2020 ice storm was the worst ice event in the Company's history). Additionally, increased flooding and/or drought could have a direct impact on the operations of our generation plants that are located near bodies of water and substations critical to our grid operations. Higher precipitation could potentially impact our vegetation management requirements and increase costs to our customers. An example of how the Company has been evaluating options to mitigate these risks for years can be seen in the Company's 2020 filing of its Oklahoma Grid Enhancement plan which focuses on resiliency and reliability of the distribution system by making investments in hardening the physical infrastructure as well as the automation and communications needed to allow the grid to respond to outages automatically. These projects were deployed in Arkansas through 2022 and are providing positive customer value and improved performance in severe weather events. Significant investments for Grid Enhancement projects in Oklahoma have and will continue to be made through 2024 and potentially beyond that timeframe.

C2.3

(C2.3) Have you identified any inherent climate-related risks with the potential to have a substantive financial or strategic impact on your business?

Yes

C2.3a

(C2.3a) Provide details of risks identified with the potential to have a substantive financial or strategic impact on your business.

Identifier

Risk 1

Where in the value chain does the risk driver occur?

Direct operations

Risk type & Primary climate-related risk driver

Technology

Transitioning to lower emissions technology

Primary potential financial impact

Increased direct costs

Company-specific description

Technology is a risk type regularly considered in the Company's assessments of climate-related risk.

As the Company increasingly adopts zero carbon generation technologies, the ability to integrate those technologies into our operations and ensure reliability and affordability is key. However, the transition to zero emitting generation technology poses risks of increased direct costs as we transition, particularly through wind and solar power in our Oklahoma and Arkansas service territory. At present the Company's generation capacity mix from zero carbon emitting renewables is 10% (percent net MWh) and some of the scenarios in the TCFD predict renewables and other future zero emitting generation technologies to comprise the majority of generation for the company by 2050. Additionally, the 2021 IRP analyzed the expansion of new technologies including solar, hydrogen capable combustion turbines and battery technologies. TCFD scenarios and the IRP also point to the potential expansion of these technologies in the next decade. The adoption and expansion of these technologies could create operating risks and additional costs if they do not operate as expected. In that situation, the intermittency of current renewables solutions would not have been sufficiently resilient or reliable to meet weather extremes that characterize our operating region.

During Winter Storm Uri in February of 2021, all of Oklahoma was declared a state-wide emergency due to extreme freezing temperatures that threatened public safety. The weather was so cold for such an extended period of time that every possible generation resource, including all OG&E available generation, was called for dispatch into the SPP

market. As noted in our regulatory filings related to the storm, during a majority of the Winter Weather Event, a third of our wind turbines were faulted due to ice accumulations. Going forward, as the mix of generation technology in the SPP (and at OG&E) increases the proportion of intermittent renewables, there could be a technology reliability risk. The SPP integrated market might struggle to meet increased electricity demand if renewable technologies are unavailable in a peak situation possibly impacting electricity customers. As a point of comparison during Winter Storm Uri, electricity users in our neighboring state experienced blackouts partially because wind resources were not available at the time—leading to tragic outcomes.

Explanation of financial impact figure

The potential financial impact is proprietary, is not disclosed, and has not been calculated at this time. The numerical value (\$0) is provided to complete the questionnaire.

Cost of response to risk

0

Description of response and explanation of cost calculation

As stated in our TCFD report, in past decades, the electric power industry, including OGE, has undergone a significant technology evolution with the adoption of wind and solar resources, and to help integrate these intermittent renewables, deployment of quick start combustion turbines into the generation fleet. We expect this evolution to continue producing cost-effective and reliable energy technology to meet customer needs and support global climate objectives. In the future, an affordable and reliable portfolio of zero carbon generation resources, including renewables, hydrogen capable generation and long-

term storage technologies, will be required. Other technology risks include the need for significant upfront financial investments, lengthy development timelines, and the uncertainty of integration and scalability across a utility's entire service area.

In our scenario analysis aligned with 1.5 degrees, the company anticipates retiring 95% of its fossil fuel generation by 2050 and replacing it with a mix of zero carbon generation resources assumed to be economically feasible, dispatchable to follow energy demand, and of long duration. To emphasize, at this time, we are unsure of the exact technology mix to be sufficiently reliable and cost effective, as current generation technologies at utility scale would not be able to meet our capacity requirements in extreme weather. In the TCFD report we describe the challenges of extreme weather in our geographic region which requires us to plan our generation availability to address weather extremes – extremely cold winter days and extremely warm summer days – while we maintain grid reliability. In our region, while we have very strong wind power growth, the wind typically is not as strong during the summer months when high temperatures mean reliable electricity generation is most needed.

The cost to respond to this risk cannot be quantified at this time given the status of the IRP process and continued uncertainty related to future conditions. OG&E regularly evaluates the risks associated with the adoption and expansion of new generating technologies by assessing its portfolio mix across the short-, medium- and long-term time horizon.

Identifier

Opp1

Where in the value chain does the opportunity occur?

Direct operations

Opportunity type

Energy source

Primary climate-related opportunity driver

Use of lower-emission sources of energy

Primary potential financial impact

Returns on investment in low-emission technology

Company-specific description

As OG&E plans its future resources and generation portfolio, the company believes there is financial opportunity in replacing older units with newer technology that uses lower-emission sources. Redeveloping existing facilities such as Horseshoe Lake provide benefits such as land, water rights, emission permits and are already strategically connected to the existing electric transmission infrastructure. In addition, their locations near OG&E's largest load center offer opportunities to maintain the locational reliability these sites have provided to OG&E's system for many years. Projects to implement more solar and combustion turbines within our operations will contribute to OG&E's technology diversity by replacing legacy steam gas resources with modern quick-start combustion turbines. Today, combustion turbines have the flexibility to utilize a hydrogen blend as a fuel; manufacturer plans to offer 100% hydrogen capable combustion turbines to the market in the next few years could align well with OG&E's goal to reduce CO2 emissions to 50 percent below 2005 levels by 2030.

Potential financial impact figure (currency)

Potential financial impact figure – minimum (currency)

Potential financial impact figure – maximum (currency)

Explanation of financial impact figure

The potential financial impact is proprietary, is not disclosed, and has not been calculated at this time. The numerical value (\$0) is provided to complete the questionnaire.

Cost to realize opportunity

0

Strategy to realize opportunity and explanation of cost calculation

OGE is realizing the opportunity to use lower emissions forms of energy by partnering with other utilities and third-party organizations to understand technology trends, pilot new solutions, and invest in technology development. As examples of our recent activities, we have invested in Energy Impact Partners, including its Deep Decarbonization Frontier Funds, participated in the State of Oklahoma's Hydrogen Production, Infrastructure, and Production Task Force, and have developed several partnerships with other utility companies on energy storage. We support collaborative research and development through partnerships with industry groups, including current engagement in EPRI's Climate READi initiative.

In 2021, Oklahoma launched the Hydrogen Production, Transportation, and Infrastructure Task Force (OK H2 Task Force) and OGE was an active participant. The Task Force was created by Oklahoma statute to develop recommendations for Oklahoma's opportunities in the production, transportation, storage and use of hydrogen as a low carbon fuel. As the nation's demand for low carbon hydrogen fuel grows, Oklahoma's pioneering culture, robust university research, and business-friendly environment combined with the state's geographically advantageous location provide strong support for the evolution of hydrogen as a fuel source. OGE is able to leverage its geographic location for solar and wind, as well as its low energy prices to encourage hydrogen adoption in Oklahoma.

In March 2022, the governors of Louisiana, Oklahoma, and Arkansas entered into a bipartisan three-state partnership, dubbed "HALO", to establish a regional hub for development, production, and use of clean hydrogen as fuel and manufacturing feedstock. As a sponsor in this effort, OGE Energy is helping mature the hydrogen economy in our region and attract new jobs to our service area. The partnership will support transformative technologies and investments to drive lower costs and increased adoption of hydrogen to reduce carbon and other emissions. In December 2022, the U.S. Department of Energy (DOE) encouraged the HALO Hydrogen Hub to submit a full application for the Regional Clean Hydrogen Hubs Program, a \$1.25 billion program administered through the Infrastructure Investment and Jobs Act (IIJA)

The potential cost to realize opportunity is proprietary is not disclosed and has not been calculated at this time. The numerical value (\$0) is provided to complete the questionnaire.

Comment

C3. Business Strategy

C3.1

(C3.1) Does your organization’s strategy include a climate transition plan that aligns with a 1.5°C world?

Row 1

Climate transition plan

Yes, we have a climate transition plan which aligns with a 1.5°C world

Publicly available climate transition plan

Yes

Mechanism by which feedback is collected from shareholders on your climate transition plan

We have a different feedback mechanism in place

Description of feedback mechanism

OGE has a well-defined and robust process to gather feedback for its Integrated Resource Plan. The Integrated Resource Plan (IRP) is produced on a triennial cycle, and it is a plan that is intended to allow the company to meet its generation capacity obligations (peak load plus a planning reserve margin) over the time horizon. OG&E’s IRP relies on a number of objectives, including the environmental stewardship commitments related to carbon emissions. It is through the integrated resource planning process that the Company, in coordination with, and subject to approval from, its state utility regulatory commissions, defines its generation planning.

The feedback process during IRP development is guided by state statute including the gathering and integration of stakeholder feedback into the IRP. The stakeholder process ensures that feedback on its assumptions and analysis methods used for integrated resource planning includes a variety of perspectives. Stakeholders in the IRP Process include a range of state agencies, regulators and other interested parties including: representatives from the Oklahoma Corporation Commission; representatives from the Arkansas Public Service Commission; representatives from the Oklahoma Attorney General and Arkansas Attorney General representing consumer interests; environmental groups such as the Sierra Club and the Oklahoma Sustainability Network; representatives from business and industry groups including the Oklahoma Industrial Energy Consumers; community representatives including tribal interests as well as other groups. The formal feedback process takes place on the triennial cycle (unless an IRP issued in a shorter timeframe in which case it aligns with the IRP timing – therefore the feedback takes place less frequently than annually).

During the development of an IRP, such as was issued in 2021, the Company develops a draft IRP, distributes copies of the draft and then holds a workshop called a “Technical Conference” to review the draft and solicit feedback. At that technical conference, the Company accepts both written and verbal comments from interested stakeholders. All of those comments are documented and included in the final IRP as “Meeting Minutes” and are publicly available. The final IRP takes into account stakeholder feedback.

Frequency of feedback collection

Less frequently than annually

Attach any relevant documents which detail your climate transition plan (optional)

C3.2

(C3.2) Does your organization use climate-related scenario analysis to inform its strategy?

Use of climate-related scenario analysis to inform strategy	
Row 1	Yes, qualitative and quantitative

C3.2a

(C3.2a) Provide details of your organization’s use of climate-related scenario analysis.

Climate-related scenario	Scenario analysis coverage	Temperature alignment of scenario	Parameters, assumptions, analytical choices
Transition scenarios Customized publicly available transition scenario	Company-wide	1.5°C	We considered multiple scenarios for our climate-related analysis. Inherent in any future-based scenario analysis is the recognition that inputs have a high level of unpredictability and are subject to change. The scenarios highlighted in our analysis focused on various possible future environments, including the possibility of carbon taxes as proxies for regulatory or market mechanisms that might shape future energy decisions. In all scenarios, we assume similar evolution of cleaner energy technology and capacity requirements. Assumptions: capacity replacement similar to the 2021 IRP retirement dates with no changes to existing laws and regulations; carbon tax sensitivity of \$20/ton

		<p>starting in 2025; carbon tax sensitivity of \$40/ton starting in 2025.</p> <p>Analytical choices: Up to 2050</p> <p>Sources: We reference two EPRI reports: “Grounding Decisions: A Scientific Foundation for Companies Considering Global Climate Scenarios and Greenhouse Gas Goals” (2018) and its 2020 update: “Review of 1.5C and Other Newer Global Emissions Scenarios: Insights for Company and Financial Climate Low-Carbon Transition Risk Assessment and Greenhouse Gas Goal Setting,” both authored by Rose and Scott, to provide the scientific foundation for identifying emissions reduction pathways for our industry.</p>
--	--	---

C3.2b

(C3.2b) Provide details of the focal questions your organization seeks to address by using climate-related scenario analysis, and summarize the results with respect to these questions.

Row 1

Focal questions

What is the resiliency of our corporate business planning and risk management process as we consider the impacts of climate-related risks and transition to cleaner energy? What future CO2 emissions pathways do we need to consider as we develop the best future portfolio that takes into consideration the following nine primary objectives: generation capacity obligation; expected cost to customers; exposure to risks; fuel and technology diversity; operational flexibility; adaptability; portfolio age; resiliency benefits; and environmental stewardship?

Results of the climate-related scenario analysis with respect to the focal questions

Our scenario analysis has found broad ranges of emissions reduction levels and carbon budgets, which are consistent with limiting average global temperature increases to between 2°C and 1.5°C. The scenarios we evaluated included: capacity replacement similar to the 2021 IRP retirement dates with no changes to existing laws and regulations, carbon tax sensitivity of \$20/ton starting in 2025, carbon tax sensitivity of \$40/ton starting in 2025. With these factors in mind, we have developed scenarios for generation capacity options up to 2050. Compared to our current mix, which consists of 25% coal, 65% gas, and 10% renewables, we project our mix to be comprised of 57% renewables, 31% future zero

carbon resources, and 12% gas or hydrogen-capable generation by 2050, with the introduction of future zero carbon resources occurring around 2040. Note that the scenarios were preliminary and all actual capacity updates will be subject to integrated resource planning and regulatory processes.

C3.3

(C3.3) Describe where and how climate-related risks and opportunities have influenced your strategy.

	Have climate-related risks and opportunities influenced your strategy in this area?	Description of influence
Products and services	Yes	Through our TCFD assessment, we have identified an opportunity to leverage our geographic location in the transition to renewable energy. Our operations are located in one of the nation’s primary wind and solar resource areas and as examples of how our strategy has been impacted by this, we were the first utility in Oklahoma to offer community solar and pioneer wind energy. Our 2021 IRP identified and recommended investments in solar resources as part of the analysis. While the full investment decisions for that IRP are still not finalized, we continue to consider solar investments that meet our requirements and provide clear value for the customer. Additionally, the Inflation Reduction Act of 2022 may also support additional investments in renewables. There is high likelihood that renewable energy will continue to be a key consideration in our portfolio decisions.
Supply chain and/or value chain	Yes	Through our TCFD assessment, OGE has identified an opportunity to partner for innovation and advance technology solutions. Our value chain strategy has been influenced by this opportunity because partnering with other utilities and third-party organizations will help us understand technology trends, pilot new solutions, and invest in technology development, such as: Investing in Energy Impact Partners (EIP)’s including its Deep Decarbonization Frontier Fund; Oklahoma’s Hydrogen Production, Infrastructure, and Production Task Force; and potential energy storage partnerships. Additionally, In March 2022, the governors of Louisiana, Oklahoma, and Arkansas entered into a bipartisan three-state partnership, dubbed

		HALO, to establish a regional hub for development, production, and use of clean hydrogen as fuel and manufacturing feedstock. As a sponsor in this effort, OGE Energy is helping mature the hydrogen economy in our region and attract new jobs to our service area. The partnership will support transformative technologies and investments to drive lower costs and increased adoption of hydrogen to reduce carbon and other emissions. In December 2022, the U.S. Department of Energy (DOE) encouraged the HALO Hydrogen Hub to submit a full application for the Regional Clean Hydrogen Hubs Program, a \$1.25 billion program administered through the Infrastructure Investment and Jobs Act (IIJA). We support collaborative research and development through partnerships with industry groups, including EPRI's Energy Systems and Climate Analysis program and current engagement in the Climate READi initiative.
Investment in R&D	Yes	Through our TCFD assessment, OGE has identified an opportunity to enhance and strengthen the grid for continued resilience. As an example of how our investments in R&D aligns with this, our Oklahoma Grid Enhancement Plan will enhance grid reliability through a significant planned investment through 2024, including new technology, equipment, and communications systems that promote a self-healing grid. Similar projects were deployed in Arkansas through 2022 and are providing positive customer value and improved performance in severe weather events. Grid resilience investments can directly address increased climate-related physical risks, while providing customers with improved service and reliability.
Operations	Yes	Through our TCFD assessment, OGE has identified a unique opportunity in its business to help make electric vehicles mainstream in the United States. As an example of how our operations have been influenced by this opportunity, OG&E plans to replace 50% of our light-duty vehicles with EVs by 2025 and 100% by 2030, which will allow us to meet our goal of reducing our fleet vehicle emissions by 60% by 2030.

C3.4

(C3.4) Describe where and how climate-related risks and opportunities have influenced your financial planning.

	Financial planning elements that have been influenced	Description of influence
Row 1	Direct costs Indirect costs Capital expenditures Capital allocation Assets	Text field [maximum 7,000 characters] The Company's Board of Directors and leadership regularly review and discuss climate-related issues when overseeing strategy and business plans. These matters may be presented by internal expertise or outside experts who inform the Board and Company leadership of specific issues. Research and development related to new technology for electricity production or storage, as part of the transition to cleaner energy, as well as planning for future capital investments, including renewables and alternative technology, are examples of topics that have been discussed at the Board and management level. In addition, our operations are subject to a number of climate-related physical and transitional risks and we have made substantial investments to maintain and enhance our grid operations. Our operations leadership reviews all risks relevant to each of their areas of responsibility and develops multi-year capital investment plans to appropriately manage each risk, including climate-related risks. We have also identified opportunities to enhance and strengthen the grid for continued resilience. As an example of how our financial planning (including capital expenditures and direct/indirect costs) has been influenced by this opportunity, our Oklahoma Grid Enhancement Plan enhances grid reliability through a significant planned investment through 2024. Components of the plan include new technology, equipment, and communications systems that promote a self-healing grid. Grid resilience investments can directly address increased climate-related physical risks, while providing customers with improved service and reliability.

C3.5

(C3.5) In your organization's financial accounting, do you identify spending/revenue that is aligned with your organization's climate transition?

	Identification of spending/revenue that is aligned with your organization's climate transition
Row 1	No, and we do not plan to in the next two years

At the end of 2018, the Company set CO2 emission reduction expectations for OG&E. Our actions to date reinforce our commitment to reducing our environmental footprint our CO2 emissions have decreased by over 40% below 2005 levels. The Company has not officially aligned with the Science-Based Targets Initiative at this time, however based upon the Company's current reductions versus 2005 baseline and the expected reductions in carbon of 50% by 2030 (see Target Abs 2) the Company believes it is in alignment with the goals put forth by the Paris Climate Agreement and the International Panel on Climate Change (IPCC) goals of limiting global temperature increase to 1.5 degrees Celsius through 2030. Referencing the attachment under C12.4, the chart superimposes the relative magnitude of OGE future emissions expectations onto a set of IPCC pathways limiting global warming to 1.5 degrees C. Note that OGE emissions through at least 2030 have superior performance to or fall within the range of IPCC pathways. Note also that emissions for the 2005 baseline year have been revised. The River Valley and Frontier power plants were acquired in 2019 by OGE Energy. Although not owned by OGE in 2005, the emissions from these power plants are included in the 2005 baseline in order to make for a complete comparison with today's fleet. The target is based only on CO2 emissions from electric generating units; we base our Abs 1 target on carbon emissions from our power plants, as they account for the vast majority of our direct emissions and are reflective of our resource planning.

Please explain target coverage and identify any exclusions

At the end of 2018, the Company set CO2 emission reduction expectations for OG&E. Our actions to date reinforce our commitment to reducing our environmental footprint our CO2 emissions have decreased by over 40% below 2005 levels. The Company has not officially aligned with the Science-Based Targets Initiative at this time, however based upon the Company's current reductions versus 2005 baseline and the expected reductions in carbon of 50% by 2030 (see Target Abs 2) the Company believes it is in alignment with the goals put forth by the Paris Climate Agreement and the International Panel on Climate Change (IPCC) goals of limiting global temperature increase to 1.5 degrees Celsius through 2030. Referencing the attachment under C12.4, the chart superimposes the relative magnitude of OGE future emissions expectations onto a set of IPCC pathways limiting global warming to 1.5 degrees C. Note that OGE emissions through at least 2030 have superior performance to or fall within the range of IPCC pathways. Note also that emissions for the 2005 baseline

year have been revised. The River Valley and Frontier power plants were acquired in 2019 by OGE Energy. Although not owned by OGE in 2005, the emissions from these power plants are included in the 2005 baseline in order to make for a complete comparison with today's fleet. The target is based only on CO₂ emissions from electric generating units; we base our Abs 2 target on carbon emissions from our power plants, as they account for the vast majority of our direct emissions and are reflective of our resource planning.

Plan for achieving target, and progress made to the end of the reporting year

OG&E's existing portfolio of electric generating facilities consists of owned thermal generation, owned renewable resources and four PPAs; however, six of OG&E's owned generation resources are planned to retire over the next 10 years. As OG&E plans its future resources and generation portfolio, the company believes there is financial opportunity in replacing older units with newer technology that uses lower-emission sources. Electricity generation with natural gas fuel which replaced coal fuel for units 4 and 5 at the Muskogee generating plant will continue to be an important source of emission reductions. Through our TCFD assessment, we have identified an opportunity to leverage our geographic location in the transition to renewable energy. Our operations are located in one of the nation's primary wind and solar resource areas and given that our 2021 IRP has identified and recommended significant investments in solar resources. While the full investment decisions for that IRP are still not finalized, we continue to consider solar investments that meet our requirements and provide clear value for the customer. Additionally, the Inflation Reduction Act of 2022 may also support additional investments in renewables. There is high likelihood that renewable energy will continue to be a key consideration in our portfolio decisions. Note that all actual capacity updates will be subject to integrated resource planning regulatory processes.

Please explain target coverage and identify any exclusions

OG&E is electrifying its transportation and service vehicle fleets and expanding its electric vehicle ("EV") charging infrastructure. The Company plans to incrementally replace its light-duty vehicle fleet until 100 percent are EVs. In September 2020, OG&E announced it would reduce greenhouse gas emissions from vehicle fleets an estimated 60% by 2030. To achieve the goal, we will replace 50 percent of our light-duty vehicles with electric vehicles (EVs) by 2025 and 100 percent by 2030. We also plan to purchase more fuel-efficient medium- and heavy-duty trucks and, where possible, reduce engine idling emissions by using Electric Power Take Off (ePTO) systems. ePTO systems power aerial buckets, cranes, hoists, augurs, and other large vehicle-mounted equipment with electricity instead of a diesel fueled engine. These actions will reduce GHG emissions by reducing the consumption of energy from non-renewable sources such as gasoline and diesel fuel. Only the light duty fleet emission reductions are characterized in the response.

Plan for achieving target, and progress made to the end of the reporting year

A schedule to 2030 has been created to incrementally purchase and increase our fleet of EVs. Concurrently, fossil-fueled light duty fleet vehicles will be phased out of service and replaced by new EVs.

List the emissions reduction initiatives which contributed most to achieving this target

C4.2

(C4.2) Did you have any other climate-related targets that were active in the reporting year?

No other climate-related targets

C4.3

(C4.3) Did you have emissions reduction initiatives that were active within the reporting year? Note that this can include those in the planning and/or implementation phases.

Yes

C4.3a

(C4.3a) Identify the total number of initiatives at each stage of development, and for those in the implementation stages, the estimated CO2e savings.

Estimated lifetime of the initiative

21-30 years

Comment

Emissions reduction initiatives that were active within the reporting year include electricity generation with natural gas fuel which replaced coal fuel. There is no monetary savings because this initiative does not provide electricity consumed by OG&E, but generated for consumption by customers.

C4.3c

(C4.3c) What methods do you use to drive investment in emissions reduction activities?

Method	Comment
Dedicated budget for energy efficiency	OG&E provides customer incentives for various types of energy efficiency, including, for example, home energy audits which inform homeowners of opportunities to reduce electricity consumption.

C4.5

(C4.5) Do you classify any of your existing goods and/or services as low-carbon products?

Yes

C4.5a

(C4.5a) Provide details of your products and/or services that you classify as low-carbon products.

Level of aggregation

Product or service

Taxonomy used to classify product(s) or service(s) as low-carbon

Other, please specify

Renewable wind and solar power are inherently low-carbon

Type of product(s) or service(s)

Power

Solar PV

Description of product(s) or service(s)

OG&E provides its customers the opportunity to purchase zero-carbon renewable energy. Currently, our growing solar PV fleet consists of eight facilities comprising approximately 32.2 MW of electricity generating capacity. OG&E also provides wind power to customers from its owned and operated OG&E wind generators (i.e., not contracted via power purchase agreement), comprising 449 MW of electricity generating capacity.

Have you estimated the avoided emissions of this low-carbon product(s) or service(s)

Yes

Methodology used to calculate avoided emissions

Other, please specify

Emissions conceptually displaced assuming that actual customer purchase of solar power would have been provided by remaining OG&E fossil and wind fleet.

Life cycle stage(s) covered for the low-carbon product(s) or services(s)

Use stage

Functional unit used

Megawatt-hours of solar power produced for customer purchase assuming all solar power produced is consumed by customers.

Reference product/service or baseline scenario used

The baseline scenario assumes that there was no solar energy product in 2022, therefore no solar power was produced and that customer power consumption was provided by OG&E's wind and fossil fleet.

Life cycle stage(s) covered for the reference product/service or baseline scenario

Use stage

Estimated avoided emissions (metric tons CO₂e per functional unit) compared to reference product/service or baseline scenario

27,462

Explain your calculation of avoided emissions, including any assumptions

Carbon intensity of OG&E generation fleet without solar generation multiplied by solar power purchased by customers. $27,462 \text{ metric tons CO}_2\text{e} = 0.597 \text{ metric tons CO}_2\text{e per MWh} * 45,984 \text{ MWh solar generation purchased}$

Revenue generated from low-carbon product(s) or service(s) as % of total revenue in the reporting year

0

Level of aggregation

Group of products or services

Taxonomy used to classify product(s) or service(s) as low-carbon

No taxonomy used to classify product(s) or service(s) as low carbon

Type of product(s) or service(s)

Power

Other, please specify

Energy Efficiency Programs

Description of product(s) or service(s)

OG&E offers a well established suite of Energy Efficiency Programs to a wide variety of customers. Key elements of the program including: Home energy efficiency programs that include: home energy assessments, home weatherization services, rebates for attic insulation, air conditioning tune ups and home upgrade rebates. The company offers a weatherization program in Oklahoma to all residential customers who own or lease a single-family, duplex, or mobile home and have a household income of less than \$60,000 a year. In Arkansas, the program is offered at no additional cost to all residential customers whose homes are more than 10 years old.

For multi-family units, the company offers services and rebates for landlords including LED lighting and weather stripping solutions. Additionally, commercial and industrial customers are offered energy efficiency programs. For example, we provide incentives for a variety of energy efficiency measures and retrofits for all educational and publicly funded facilities within our service territory. We also offer free educational opportunities to help administrative personnel identify and quantify energy-saving opportunities.

Through reductions in energy consumption that are measured and reported, the company then estimates the emissions it was able to reduce versus baseline.

Have you estimated the avoided emissions of this low-carbon product(s) or service(s)

Yes

Methodology used to calculate avoided emissions

Other, please specify

Emissions avoided from power not purchased by customers because energy efficiency measures reduce customer demand.

Life cycle stage(s) covered for the low-carbon product(s) or services(s)

Use stage

Functional unit used

Megawatt-hours of power not consumed due to reduced customer demand as a result of energy efficiency measures.

Reference product/service or baseline scenario used

Megawatt-hours of power presumed purchased by customers in the absence of energy efficiency measures.

Life cycle stage(s) covered for the reference product/service or baseline scenario

Use stage

Estimated avoided emissions (metric tons CO₂e per functional unit) compared to reference product/service or baseline scenario

126,977

Explain your calculation of avoided emissions, including any assumptions

Carbon intensity of OG&E generation fleet multiplied by electricity not purchased by customers due to energy efficiency measures. $126,977 \text{ metric tons CO}_2\text{e} = 0.59 \text{ metric tons CO}_2\text{e per MWh} * 213,201 \text{ MWh}$

Power

Other, please specify

Grid power made up of zero-carbon renewable, hydro and nuclear and fossil-fueled sources.

Description of product(s) or service(s)

Demand Response “Smart Hours” Program. OGE offers a unique demand response program that uses smart meter technology, programmable thermostats and price signals to allow customers to reduce their consumption of electricity and save money. OG&E’s original Smart Hours program included a programmable thermostat installed in the home that allowed customers to receive price signals and set their energy usage based on price signals during the hot summer months. Currently, OG&E has teamed up with IFTTT to take SmartHours and smart thermostats to the next level. IFTTT stands for “If This, Then That” enabling technology works with smart thermostats to react to daily price signals. Customers set their smart thermostat to react to low, standard, high and critical rates and OG&E communicates the daily rate. The demand response program has allowed customers to reduce energy consumption and save money. The program calculates the energy consumption reductions and the company then uses its emissions factor to calculate emissions foregone versus the alternative

Have you estimated the avoided emissions of this low-carbon product(s) or service(s)

Yes

Methodology used to calculate avoided emissions

Other, please specify

Emissions avoided from power not purchased when Smart Hours reduces customer demand.

Life cycle stage(s) covered for the low-carbon product(s) or services(s)

Use stage

Functional unit used

Megawatt-hours of power not consumed due to reduced customer demand as a result Smart Hours participation.

Reference product/service or baseline scenario used

The baseline scenario assumes that customer power consumption would have increased in an amount equivalent to the amount actually saved by using the Smart Hours product.

Life cycle stage(s) covered for the reference product/service or baseline scenario

Use stage

Estimated avoided emissions (metric tons CO2e per functional unit) compared to reference product/service or baseline scenario

8,485

Explain your calculation of avoided emissions, including any assumptions

Carbon intensity of OG&E generation fleet multiplied by electricity not purchased by customers due to demand reduction measures.

8,485 metric tons CO₂e = 0.59 metric tons CO₂e per MWh * 14,308 MWh

Revenue generated from low-carbon product(s) or service(s) as % of total revenue in the reporting year

C-EU4.6

(C-EU4.6) Describe your organization's efforts to reduce methane emissions from your activities.

Methane emission sources consist of fugitive emissions from fuel supply infrastructure at natural gas-fueled power plants, and the methane fraction of direct CO₂e emissions from all fossil-fueled power plants. As a specific example of our fugitive methane reduction efforts, all eight power generation facilities that consume gas (including two of our largest gas-fueled facilities located in Oklahoma City and Jones, Oklahoma), undergo routine facility-wide inspections and maintenance which acts to minimize the amount of fugitive methane emissions and leakages. The facility-wide inspections vary, depending on the facility, but may include piping components such as valves and flanges that supply natural gas to burners, and equipment condition and function. When issues are identified, site managers deploy maintenance personnel to ensure these are addressed as soon as possible. OGE has been investing heavily in renewable energy over the past 3 years and will continue to do so; the extent to which those investments displace fossil-fueled generation will act to reduce the already minimal emission of methane in our activities.

As a case study of our methane emission reduction efforts, while methane comprises a fraction of a percent of emissions from the Company's activities (approximately 0.1 % of scope 1 CO₂e), OGE still takes actions to reduce methane emissions, in part, by deploying zero-methane generation sources such as wind and solar. In 2020 OG&E owned and contracted for 844 MW of electrical generation capacity from wind technologies. In October 2020, OG&E completed two 5-megawatt (MW) solar energy farms in southeast Oklahoma, one in Davis, Oklahoma, and one in Durant, Oklahoma, to help meet the renewable energy needs of the Chickasaw Nation and the Choctaw Nation respectively. During 2022, OG&E completed expansion of the Choctaw Nation/OG&E Solar Energy Center by an additional 5 MW bringing the total solar capacity to 10 MW at that facility. Also during 2021, OG&E initiated operation of its first solar farm in Arkansas, a 5 MW solar farm near Branch, Arkansas. The new farms, along with the Company's existing solar farms in Mustang, Oklahoma, and in Covington, Oklahoma are expected to bring total solar capacity to approximately 32 MW since beginning development of solar power installations in 2015.

C5. Emissions methodology

C5.1

(C5.1) Is this your first year of reporting emissions data to CDP?

No

C5.1a

(C5.1a) Has your organization undergone any structural changes in the reporting year, or are any previous structural changes being accounted for in this disclosure of emissions data?

Row 1

Has there been a structural change?

No

C5.1b

(C5.1b) Has your emissions accounting methodology, boundary, and/or reporting year definition changed in the reporting year?

	Change(s) in methodology, boundary, and/or reporting year definition?
Row 1	No

C5.2

(C5.2) Provide your base year and base year emissions.

Scope 1

Base year start

January 1, 2005

Base year end

December 31, 2005

Base year emissions (metric tons CO₂e)

24,255,671

Comment

Scope 1 emissions for the 2005 baseline year were revised in our 2022 report. Although not owned by OGE in 2005, the emissions from the River Valley and Frontier power plants

are now included in the 2005 baseline in order to make for a complete comparison with today's fleet which includes these facilities. Included in the Scope 1 base year are 2005 CO₂e emissions from electric generating units and SF₆ fugitive emissions. Not available for 2005 are vehicle emissions and refrigerant emissions – based on the current fleet, it is anticipated these sources would account for approximately 0.10% of total Scope 1 emissions.

Scope 2 (location-based)

Base year end

December 31, 2021

Base year emissions (metric tons CO₂e)

6,197,295

Comment

Scope 3 emissions are comprised of electricity supplied by the Southwest Power Pool Integrated Market and sold by OG&E to ultimate consumers. The emissions rate used in our Scope 3 calculation is developed by the US EPA and provided through the eGRID program. The carbon intensity factor is 0.42 metric tons CO₂e per MWh, for calendar year 2020. Annual electricity sold is from SEC Form 10-K for calendar year 2021. The formula is: MWh electricity sold multiplied by carbon intensity as metric tons CO₂e gives metric tons of CO₂e. Emissions are derived as: purchased power as reported in SEC 10-K multiplied by US EPA emission factor for the SPP south region in which OG&E generating facilities are located. $14,600,000 \text{ MWh} * (935.8 \text{ pounds per MWh} / 2204.62 \text{ pounds per metric ton}) = 6,197,295 \text{ metric tons}$.

- US EPA Emissions & Generation Resource Integrated Database (eGRID)
- Other, please specify
- WRI Quantis Scope 3 spend-based estimating model.

C6. Emissions data

C6.1

(C6.1) What were your organization's gross global Scope 1 emissions in metric tons CO₂e?

Reporting year

Gross global Scope 1 emissions (metric tons CO₂e)

10,004,682

Comment

OGE's power generation greenhouse gas emissions, or approximately 99% of its scope 1 emissions, will continue to vary year-to-year based on a variety of factors, including some outside our control. These factors include but are not limited to, the composition of our generating fleet, changing dispatch needs to meet reliability requirements within the SPP footprint, and fluctuations in customer demand for energy in the SPP market,

As noted in section C0.5, OGE's reporting boundary reflects the operational control approach. For reference however, OGE's 2022 scope 1 emissions under a financial control reporting boundary would be 8,948,353 metric tons CO₂e; the financial control approach would exclude the portions of the McClain and Redbud power plants which OGE operates on behalf of its partners, but which are not owned by OGE.

C6.2

(C6.2) Describe your organization's approach to reporting Scope 2 emissions.

Row 1

Scope 2, location-based

We are reporting a Scope 2, location-based figure

Scope 2, market-based

We have operations where we are able to access electricity supplier emission factors or residual emissions factors, but are unable to report a Scope 2, market-based figure

Comment

C6.3

(C6.3) What were your organization's gross global Scope 2 emissions in metric tons CO₂e?

Reporting year

Scope 2, location-based

121,000

Comment

Scope 2 emissions are generally defined in the GHG protocols to include indirect GHG emissions associated with the purchase and acquisition of electricity for use by the organization. For purposes of our calculation of Scope 2 emissions, we use an estimate of approximately 1% of Scope 1 emissions based on a multi-year average of electricity usage. OGE is continuing to work collaboratively with EEI and EPRI on technically sound approaches to address estimation inaccuracies such as double-counting issues when evaluating Scope 2 GHGs from the energy industry. Our company will leverage the insights from research and other industry efforts to inform updates to different voluntary GHG accounting frameworks and potential mandatory regulatory reporting requirements. This will support more consistent, accurate, and comparable GHG emissions information for the energy industry and our external stakeholders.

C6.4

(C6.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1, Scope 2 or Scope 3 emissions that are within your selected reporting boundary which are not included in your disclosure?

No

C6.5

(C6.5) Account for your organization's gross global Scope 3 emissions, disclosing and explaining any exclusions.

Purchased goods and services

Evaluation status

Relevant, not yet calculated

Please explain

OGE is engaging with partners and vendors and we support industry efforts to improve our industry's understanding of voluntary corporate GHG accounting protocols. We continue to work collaboratively with EEI and EPRI on technically sound approaches for evaluating Scope 3 GHGs in our industry and refining our estimates.

Capital goods

Evaluation status

Not relevant, explanation provided

Please explain

OGE is engaging with partners and vendors and we support industry efforts to improve our industry's understanding of voluntary corporate GHG accounting protocols. We continue to work collaboratively with EEI and EPRI on technically sound approaches for evaluating Scope 3 GHGs. We do not expect capital goods to represent a relevant portion of our total Scope 3 GHG emissions.

Fuel-and-energy-related activities (not included in Scope 1 or 2)

Evaluation status

Relevant, calculated

Emissions in reporting year (metric tons CO₂e)

8,624,000

Emissions calculation methodology

Other, please specify

10-K purchased MWh = 19,000,000 multiplied by Y2021 SPP-SO CO₂e factor = 1037 lb co₂e/MWh (~0.47 metric ton / MWh) - [Note that the Y2021 SPP-SO factor is from US EPA and was the most recent available at the time of filing]

Percentage of emissions calculated using data obtained from suppliers or value chain partners

100

Please explain

OGE is engaging with partners and vendors and we support industry efforts to improve our industry's understanding of voluntary corporate GHG accounting protocols. We continue to work collaboratively with EEI and EPRI on technically sound and consistent approaches for evaluating Scope 3 GHGs. Fuel-and-energy-related activities include only those indirect emissions associated with power purchased from the SPP Integrated Market for sale and

delivery to our customers as reported on the OGE Energy Corp SEC form 10-K. The associated carbon intensity is EPA's eGRID 2021 emissions factor for the SPP south region. Our reported number does not include any additional Scope 3 emission sources such as upstream emissions associated with purchased fuel for power generation.

Upstream transportation and distribution

Evaluation status

Not relevant, explanation provided

Please explain

We do not have operations that include transporting and distributing goods purchased from suppliers. Therefore, there are no emissions under this category.

Waste generated in operations

Evaluation status

Not relevant, explanation provided

Please explain

OGE is engaging with partners and vendors and we support industry efforts to improve our industry's understanding of voluntary corporate GHG accounting protocols. We continue to work collaboratively with EEI and EPRI on technically sound and consistent approaches for evaluating Scope 3 GHGs. We do not expect waste generated from our operations to represent a relevant portion of our total Scope 3 GHG emissions.

Business travel

Evaluation status

Not relevant, explanation provided

Please explain

OGE is engaging with partners and vendors and we support industry efforts to improve our industry's understanding of voluntary corporate GHG accounting protocols. We continue to work collaboratively with EEI and EPRI on technically sound and consistent approaches for evaluating Scope 3 GHGs. We do not expect business travel to represent a relevant portion of our total Scope 3 GHG emissions.

Employee commuting

Evaluation status

Not relevant, explanation provided

Please explain

OGE is engaging with partners and vendors and we support industry efforts to improve our industry's understanding of voluntary corporate GHG accounting protocols. We continue to

work collaboratively with EEI and EPRI on technically sound and consistent approaches for evaluating Scope 3 GHGs. We do not expect employee commuting to represent a relevant portion of our total Scope 3 GHG emissions.

Upstream leased assets

Evaluation status

Not relevant, explanation provided

Please explain

OGE does not use leased assets in any part of its operations. Therefore, there are no emissions under this category.

Downstream transportation and distribution

Evaluation status

Not relevant, explanation provided

Please explain

OGE has no transportation or distribution of sold products by vehicles, from facilities not owned or controlled by us, or emissions from retail and storage. Therefore, there are no emissions under this category.

Processing of sold products

Evaluation status

Not relevant, explanation provided

Please explain

Electricity, OGE Energy's sold product, does not require processing after it is purchased by customers; it is simply consumed. Therefore, there are no emissions under this category

Use of sold products

Evaluation status

Not relevant, explanation provided

Please explain

Emissions from the production of electricity, OGE Energy's sold product, are accounted for under Scope 1 emissions, and electricity does not emit additional greenhouse gases after it is produced. Therefore, there are no emissions from customer use of purchased electricity.

End of life treatment of sold products

Evaluation status

Not relevant, explanation provided

Please explain

Electricity, OGE Energy's sold product, is not disposed of nor does it undergo waste treatment – it essentially disappears upon use. Therefore, there are no emissions under this category.

Downstream leased assets

Evaluation status

Not relevant, explanation provided

Please explain

OGE Energy does not lease assets to other entities. Therefore, there are no emissions under this category.

Franchises

Evaluation status

Not relevant, explanation provided

Please explain

OGE Energy does not have franchises as defined by The GHG Protocol which says: "A franchise is a business operating under a license to sell or distribute another company's goods or services within a certain location." Therefore, there are no emissions under this category.

Investments

Evaluation status

Not relevant, explanation provided

Please explain

We do not have emissions from investments.

Other (upstream)

Evaluation status

Not relevant, explanation provided

Please explain

We do not have emissions from other upstream sources.

Other (downstream)

Evaluation status

Not relevant, explanation provided

Please explain

We do not have emissions from other downstream sources.

C6.7

(C6.7) Are carbon dioxide emissions from biogenic carbon relevant to your organization?

No

C6.10

(C6.10) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO₂e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations.

Intensity figure

0.003

Metric numerator (Gross global combined Scope 1 and 2 emissions, metric tons CO₂e)

10,125,682

Metric denominator

unit total revenue

Metric denominator: Unit total

3,375,570,000

Scope 2 figure used

Location-based

% change from previous year

21

Direction of change

Decreased

Reason(s) for change

Change in output
Change in revenue

Please explain

The numerator (i.e., emissions) decreased approximately 20.7% relative to 2021 and the denominator (total revenue) decreased approximately 7.6% in 2022. Emissions continue to reflect the presence of our low-carbon energy generation initiative

described in C4.3b, namely, gas-fueled generation which replaced coal-fueled generation, was active and remains effective.

C7. Emissions breakdowns

C7.1

(C7.1) Does your organization break down its Scope 1 emissions by greenhouse gas type?

Yes

C7.1a

(C7.1a) Break down your total gross global Scope 1 emissions by greenhouse gas type and provide the source of each used greenhouse warming potential (GWP).

Greenhouse gas	Scope 1 emissions (metric tons of CO2e)	GWP Reference
CO2	10,004,682	IPCC Sixth Assessment Report (AR6 - 100 year)
CH4	16,093	IPCC Sixth Assessment Report (AR6 - 100 year)

C7.9

(C7.9) How do your gross global emissions (Scope 1 and 2 combined) for the reporting year compare to those of the previous reporting year?

Decreased

C7.9a

(C7.9a) Identify the reasons for any change in your gross global emissions (Scope 1 and 2 combined), and for each of them specify how your emissions compare to the previous year.

	Change in emissions (metric tons CO2e)	Direction of change in emissions	Emissions value (percentage)	Please explain calculation

Change in renewable energy consumption	5,499	Decreased	0.05	<p>OGE Energy consumes electricity that is produced within the SPP IM, a wholesale power market in the central United States on behalf of a diverse group of utilities and transmission companies in 14 states. The share of power produced by renewables in the SPP during 2022 increased from 34.7% to 38.3%, a 3.6-point increase over 2021. Therefore, the quantity of zero-emission renewable energy consumed at OGE Energy facilities also increased by 3.6%, equivalent to an emissions decrease of 3.6% from 2021 Scope 2 emissions which is equivalent to 5499 metric tons. Therefore, the percentage reduction from Scope 1 and 2 combined is 0.05%. $((10,125,682 - 5499) / 10,125,682) * 100 = 0.05\%$</p>
Other emissions reduction activities	756.3	Increased	8.7	<p>Vehicle fleet emissions were increased due to increased fleet usage. However, fleet emissions are lower than they would otherwise have been in part due to the deployment of electric vehicles in the OG&E fleet. OG&E encourages the use of electric vehicles (EVs) and is expanding its EV charging infrastructure, electrifying its fleet of electric vehicles, and, at its Advanced Technologies Lab, is testing advanced technologies to cost effectively integrate EV charging infrastructure into the OG&E territory. In September 2020, OG&E announced its goal to reduce greenhouse gas emissions from vehicle fleets an estimated 60% by 2030. To achieve the goal, we will replace 50 percent of our light-duty vehicles with electric vehicles (EVs) by 2025 and 100 percent</p>

				<p>by 2030. We also will purchase more fuel-efficient medium- and heavy-duty trucks and, where possible, reduce engine idling emissions by using Electric Power Take Off (ePTO) systems. ePTO systems power aerial buckets, cranes, hoists, augurs, and other large vehicle mounted equipment with electricity instead of a diesel fueled engine. These actions will reduce GHG emissions by reducing or eliminating the consumption of energy from non-renewable sources such as gasoline and diesel fuel. Fleet emissions in 2021 were 8667 metric tons and 9423.5 metric tons in 2022. $((9423 - 8667.2) / 8667.2) * 100 = 8.7\%$</p>
Divestment	0	No change	0	No divestment activities occurred for OGE Energy during 2022 related to emission-producing assets within our operational control reporting boundary, therefore this question is not applicable.
Acquisitions	0	No change	0	No acquisition activities occurred for OGE Energy during 2022, therefore this question is not applicable.
Mergers	0	No change	0	No merger activities occurred for OGE Energy during 2022, therefore this question is not applicable.
Change in output	2,650,151	Decreased	20.7	Emissions decreased by 20.7% percent in 2022 compared to 2021 due to decreased generation of electricity. Combined Scopes 1 and 2 emissions for 2022 and 2021, respectively were 10,125,682 metric ton and 12,775,833 metric ton. $((10,125,682 - 12,775,833) / 12,775,833) * 100 = -20.7\%$
Change in methodology	0	No change	0	Methodology was unchanged.

Change in boundary	0	No change	0	Boundary was unchanged.
Change in physical operating conditions	0	No change	0	Physical operating conditions were unchanged.
Unidentified	0	No change	0	All emission change activities are identified here.
Other	0	No change	0	All emission change activities are identified here.

C7.9b

(C7.9b) Are your emissions performance calculations in C7.9 and C7.9a based on a location-based Scope 2 emissions figure or a market-based Scope 2 emissions figure?

Plants within the OGE operational reporting boundary, including 100% of the Redbud and McClain facilities which OG&E operates on behalf of itself and its co-owners, comprise a capacity of 7947 MW. Plants within the OGE financial reporting boundary, including 51% of the Redbud and 77% of the McClain facilities which OG&E owns, comprise a capacity of 7240 MW.

As a member of the Southwest Power Pool (SPP) regional transmission organization (RTO) and participant in its 14-state Integrated Market, OG&E customers get the benefit of increased clean energy resources from across the

SPP Integrated Market while maintaining reliability and affordability. Renewable energy including wind, solar, storage (e.g., batteries), and hybrid storage-battery installations represent 97% of new generation requests in the SPP

through 2022, far outpacing all other RTOs across the nation. In 2022, energy generation (MWh) from wind was the top generation source in the SPP at over 37%.

C12. Engagement

C12.1

(C12.1) Do you engage with your value chain on climate-related issues?

Yes, our suppliers
Yes, our customers/clients

C12.1a

(C12.1a) Provide details of your climate-related supplier engagement strategy.

Type of engagement

Innovation & collaboration (changing markets)

Details of engagement

Other, please specify

Climate change is integrated into supplier evaluation processes and we also collect climate change and carbon information annually from key suppliers through a survey.

% of suppliers by number

70

% total procurement spend (direct and indirect)

80

% of supplier-related Scope 3 emissions as reported in C6.5

0

Rationale for the coverage of your engagement

OGE engages with 100% of suppliers through our Supplier Code of Conduct and/or OG&E Code of Ethics, not only because it is one of our requirements, but also because we believe it is crucial for 100% of our suppliers to be engaged in these processes and procedures. As described in the OGE Energy Supplier Code of Conduct, our commitment to environmental stewardship begins with our belief that we are only as strong as the communities we serve, and, therefore, the responsibility of compliance with applicable environmental rules and regulations. When we released our Supplier Code of Conduct in 2021, it was sent to 100% of our suppliers with over 70% acknowledging receipt. In 2022, 100% of new suppliers acknowledged review of the Supplier Code of Conduct. When the Supplier Code of Conduct is next updated 100% of suppliers will be expected to acknowledge review of the update. The 70% (by count) of our suppliers who acknowledged receipt accounted for more than 80% of our 2021 spend. We actively seek suppliers that share our commitment to respect environmental stewardship. We expect suppliers to know and understand the environmental issues related to their operations and to abide by the letter and spirit of all the associated laws, rules, and regulations for those operations. Through ongoing review and evaluation, suppliers may be required to provide documentation to demonstrate shared commitment to environmental sustainability and stewardship.

Impact of engagement, including measures of success

The OG&E Supplier Code of Conduct demonstrates to our supply base the importance sustainability has within our organization. Suppliers understand that to continue to do business with OG&E, they must share a similar commitment to environmental stewardship. OG&E continues to advance our value chain engagement through best practice sharing, industry benchmarking, and approaching suppliers with environmental impact reduction opportunities identified through survey. Success is measured by obtaining an 80% response rate from the suppliers surveyed and by seeing our supply base implement environmental improvement plans based on survey responses and OG&E expectations. In 2022, OG&E received responses from 80% of the suppliers that were surveyed meeting our objectives.

Comment

As described in the OGE Energy Supplier Code of Conduct, our commitment to environmental stewardship begins with our belief that we are only as strong as the communities we serve, and therefore the responsibility of compliance with applicable environmental rules and regulations extends to our suppliers. It is a balance of delivering reliable and affordable electricity to our customers and maintaining a culture of innovation and environmental stewardship that helps to serve the needs of our communities now and in the future. We continuously evaluate the needs of our stakeholders to meet the ever

dynamic and growing needs of our communities and to honor our commitment to minimize our environmental footprint. At OGE Energy Corp. we actively seek suppliers that share our commitment to respect and honor environmental stewardship. We expect suppliers to know and understand the environmental issues related to their operations and to abide by the letter and spirit of all the associated laws, rules, and regulations for those operations. Through ongoing review and evaluation, our suppliers may be required to provide documentation to demonstrate a shared commitment to environmental sustainability and stewardship. Our Supplier Code of Conduct can be accessed here:
<https://www.oge.com/wps/wcm/connect/532ff545-eb14-415b-af4b-d76350bcbb26/OGE+ENERGY+ESG+Supplier+Code+of+Conduct.pdf?MOD=AJPERES&CVID=ojGtbZU>

C12.1b

(C12.1b) Give details of your climate-related engagement strategy with your customers.

Type of engagement & Details of engagement

Education/information sharing

Run an engagement campaign to educate customers about the climate change impacts of (using) your products, goods, and/or services

% of customers by number

100

% of customer - related Scope 3 emissions as reported in C6.5

0

Please explain the rationale for selecting this group of customers and scope of engagement

OG&E engages with its customers by offering a variety of energy efficient services and by providing information around these offerings via our website. OG&E's Energy Efficiency programs in Oklahoma and Arkansas include, but are not limited to, efforts to improve weatherization, lighting, heating, ventilation and air conditioning systems. The percentage of engaged customers is 100% because all customers are eligible to opt into these programs. Additionally, information around each of these programs is publicly communicated and available through our website and in customer bills, and an outside contractor uses social media, direct mail and emails to engage OG&E's customers for these program offerings. As one example of these offerings, the SmartHours Program integrates technology and pricing to help customers reduce energy usage at peak times. Customers respond to price signals between the non-holiday weekday hours of 2:00 p.m. and 7:00 p.m. over the summer months to help reduce the peak demand on the system by more than 100 MW. Another example is the Residential Weatherization Program, which is a form of customer energy

efficiency to reduce electricity consumption from home heating and cooling. OGE is currently adopting a new strategy and electronic platform to provide a hyper-personalized experience for customers through data analysis that customizes potential energy recommendations, product offerings, and program promotions to the specific individual energy behaviors and interactions. This digital-first approach maximizes cost-effectiveness and equitable customer access. The company will be providing dynamic home energy reports, energy insights, and a marketplace to source energy efficiency products.

Impact of engagement, including measures of success

Historically, OG&E's Energy Efficiency programs in Oklahoma and Arkansas have achieved between 30 MW and 40 MW of incremental demand reduction each year; OG&E's Energy Efficiency programs are projected to add nearly 40 MW of demand reduction each year. Our Load Reduction Rider offers rate incentives to commercial and industrial customers that can reduce their electrical load when notified by OG&E. OG&E spent over \$41 million for energy efficiency initiatives in 2021 and \$44 million in 2022 primarily on 3 programs entitled: Low Income Weatherization, Home Energy Efficiency and Commercial Energy Efficiency programs. In 2021 and 2022 combined, over 300,000 projects were completed across these programs and our service territory. OG&E measures the success of our EE efforts through annual energy savings goals and in both 2021 and 2022 exceeded the kWh goal by 9% (2021 goal versus achieved for combined Oklahoma and Arkansas 183 v 199 MWH and 2022 goal versus achieved of 195 v 213 MWH). The results are considered successful at achieving objectives of both savings and customer satisfaction. An example of the programs, the OG&E Weatherization program targets low-income customers and helps them improve the efficiency of their homes, and thereby, helps them reduce their electricity bills. In 2021 and 2022, the goal of weatherizing 3,400 homes was exceeded in 2021 by 9% and met in 2022 in Oklahoma and was considered a success. These programs are evaluated based on savings achieved as well as customer satisfaction survey results. A representative sample of customers is surveyed by program channel annually and outside evaluators consider the programs successful both from a savings achieved and customer satisfaction standpoint. Survey responses for each program are reported in annual evaluation reports by state filed with the respective commissions. For example, for the weatherization program, 83% of respondents in Arkansas stated that they would recommend OG&E's weatherization program and services to others and over 84% of respondents in Oklahoma were satisfied with OG&E's weatherization program. OGE considers the EE programs and demand response program successful from an engagement standpoint as well as from an energy savings perspective in 2021 as well as 2022.

C12.2

(C12.2) Do your suppliers have to meet climate-related requirements as part of your organization's purchasing process?

No, and we do not plan to introduce climate-related requirements within the next two years

C12.3

(C12.3) Does your organization engage in activities that could either directly or indirectly influence policy, law, or regulation that may impact the climate?

Row 1

External engagement activities that could directly or indirectly influence policy, law, or regulation that may impact the climate

Yes, our membership of/engagement with trade associations could influence policy, law, or regulation that may impact the climate

Yes, we fund organizations or individuals whose activities could influence policy, law, or regulation that may impact the climate

Does your organization have a public commitment or position statement to conduct your engagement activities in line with the goals of the Paris Agreement?

No, but we plan to have one in the next two years

Describe the process(es) your organization has in place to ensure that your external engagement activities are consistent with your climate commitments and/or climate transition plan

All of OGE's influence and policy efforts are coordinated within the executive office of the Vice President of Public and Regulatory Affairs. Regular coordination and discussion among executives concerning climate strategy and public policy engagement ensures that our engagement activities are consistent with our overall climate change strategy.

C12.3b

(C12.3b) Provide details of the trade associations your organization is a member of, or engages with, which are likely to take a position on any policy, law or regulation that may impact the climate.

Trade association

Edison Electric Institute (EII)

Is your organization's position on climate change policy consistent with theirs?

Consistent

Has your organization attempted to influence their position in the reporting year?

Yes, we publicly promoted their current position

Describe how your organization’s position is consistent with or differs from the trade association’s position, and any actions taken to influence their position

EEl’s member companies are leading a clean energy transformation. We are committed to getting the energy we provide as clean as we can as fast as we can, without compromising customer affordability and reliability. Today, carbon emissions from the U.S. electric power sector are as low as they were almost 40 years ago, while electricity use has climbed 73 percent since then.

EEl’s member companies are continuing to work to reduce carbon emissions in our sector and are committed to helping other sectors—particularly the transportation and industrial sectors—transition to clean, efficient electric energy. This is just the start. With investments in new technologies and the right policies, we can do even more to build a cleaner, stronger economy together.

Going forward, electric companies will continue to make significant carbon reductions. The robust clean energy tax package included in the Inflation Reduction Act will provide substantial long-term benefits to electricity customers across America. When taken together with the CHIPS and Science Act and the bipartisan Infrastructure Investment and Jobs Act, these policies strongly support the technologies needed to accelerate the deployment of new clean energy resources, electric vehicle charging infrastructure, and middle-mile broadband. They also support the development of the next generation of innovative new technologies that will help electric companies deliver a resilient clean energy future faster and more affordably to customers.

Implementing these new laws will take a significant amount of work. That is why EEl continues to coordinate and to lead industry efforts related to implementation and funding, working to ensure that America’s electric companies and their state and local governments are ready and able to access and to use new federal infrastructure funds and programs.

EEl advocates for policies that:

Enable the siting, permitting, and construction of new technologies and the transmission infrastructure we need to deliver clean energy to customers.

Enhance energy grid modernization and resilience.

Leverage electric power sector emission reductions to reduce emissions in other sectors of the economy.

The funding figure for EEl is confidential.

Funding figure your organization provided to this trade association in the reporting year (currency as selected in C0.4)

0

Describe the aim of your organization’s funding

Have you evaluated whether your organization's engagement with this trade association is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

C12.3c

(C12.3c) Provide details of the funding you provided to other organizations or individuals in the reporting year whose activities could influence policy, law, or regulation that may impact the climate.

Type of organization or individual

Research organization

State the organization or individual to which you provided funding

The Electric Power Research Institute (EPRI)

Funding figure your organization provided to this organization or individual in the reporting year (currency as selected in C0.4)

0

Describe the aim of this funding and how it could influence policy, law or regulation that may impact the climate

EPRI conducts research, development, and demonstration projects for the benefit of the public in the United States and internationally. As an independent, non-profit organization for public interest energy and environmental research, EPRI focuses on electricity generation, delivery, and use in collaboration with the electricity sector, its stakeholders, and others to enhance the quality of life by making electric power safe, reliable, affordable, and environmentally responsible. Among many other things, EPRI conducts research into various aspects of climate change including scenario analysis and transition planning. OGE participates in various EPRI research and industry initiative groups and the funding of those efforts provides funding participants with access to the research, the experts at EPRI, as well as an ability to participate in EPRI groups for information gathering as well as contributions to research. We partner with EPRI to provide the necessary research and climate science expertise to model against a lower carbon future. For example, through our support of EPRI's Energy Systems and Climate Analysis program and current engagement in EPRI's Climate READi initiative, we support the development of modelling tools that provide insights regarding the cost and performance of policy alternatives related to future climate-related regulations. EPRI's research found broad ranges of emissions pathways, as well as carbon emissions reduction levels and carbon budgets, which are consistent with limiting average global temperature increases to between 2 C and 1.5 C, and EPRI

research served as a basis for our TCFD scenario analysis. Additionally, we participate in various EPRI groups related to ESG trends and disclosures as well as groups related to our grid operations. In terms of how it could impact policy, law or regulation related to the climate, EPRI's research is utilized to develop climate scenarios in the industry. Additionally, EPRI has also been engaged in discussions related to the SEC's proposed rulemaking related to climate disclosures and brings its deep climate science knowledge as well as its understanding of energy systems to bear in its comments. The funding figure for EPRI is confidential.

Have you evaluated whether this funding is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

C12.4

(C12.4) Have you published information about your organization's response to climate change and GHG emissions performance for this reporting year in places other than in your CDP response? If so, please attach the publication(s).

Comment

The OGE Energy Corporate Stewardship Report describes the Company's commitment to responsible stewardship and community growth, including climate-related targets and metrics. The report provides a broad range of information and data related to customer commitment and assistance, community contribution, economic development, energy management, workforce safety and development, environmental stewardship including clean energy and resource management as well as corporate governance. Additionally, SASB reporting is incorporated into this report.

Comment

The EEI ESG/Sustainability template was developed under the guidance of the joint EEI-AGA member company ESG/Sustainability Steering Committee and an ESG/Sustainability Investor Group. The Steering Committee consists of a diverse group of member company representatives from various disciplines (e.g., Accounting, Environment, ESG/Sustainability, Finance/Treasury, Investor Relations, and Legal), and the Investor Group consists of a diverse group of institutional investors from various disciplines (e.g., Asset Management, ESG/Sustainability, Investment Banking and Research Analysis). The template has been developed in response to the desire of investors and other stakeholders for ESG/Sustainability information that is consistent across the sector in terms of accessibility, content, timing, and presentation. Portfolio, emissions, and resources are included on the 'EEI Metrics' tab for electric company disclosure. The Portfolio area comprises metrics related to an electric company portfolio such as power generation data by resource type; the Emissions area comprises metrics on electric company GHG emissions and criteria emissions; the Resources area comprises metrics on electric company human resources and natural resources.

C12.5

(C12.5) Indicate the collaborative frameworks, initiatives and/or commitments related to environmental issues for which you are a signatory/member.

	Environmental collaborative framework, initiative and/or commitment	Describe your organization’s role within each framework, initiative and/or commitment
Row 1	Other, please specify OG&E was a founding member of the SF6 Emission Reduction Partnership for Electric Power Systems , a collaborative effort between US EPA and the power industry to identify, recommend, and implement cost-effective solutions to reduce SF6 emissions.	OG&E participates in various workshops and derives values from technical resources made available through the partnership.

C15. Biodiversity

C15.1

(C15.1) Is there board-level oversight and/or executive management-level responsibility for biodiversity-related issues within your organization?

	Board-level oversight and/or executive management-level responsibility for biodiversity-related issues	Description of oversight and objectives relating to biodiversity
Row 1	Yes, executive management-level responsibility	<p>The Company’s environmental, biodiversity risk management responsibilities report to the VP of Operations who reports to the Company’s CEO. OG&E’s objectives related to biodiversity include combining forces with trusted organizations, government entities and nonprofits to promote biodiversity through habitat conservation, and to demonstrate corporate stewardship by pursuing partnerships with public and private community members to help protect biodiversity in the regions we serve.</p> <p>Our recent accomplishments include preserving and expanding habitats for endangered species of concern as well as jumpstarting cleanup projects. We’ve helped support the iconic Monarch butterfly during its fall and spring migration by planting butterfly “Waystations.” We’ve planted 30 acres of pollinator habitat with another 30 acres underway; automated solar-powered mowers reduce maintenance costs and limit human activity on site. OGE</p>

		<p>voluntarily takes measures to protect wildlife collisions with electrical equipment and takes pride in the innovative ways we work to keep animals safe. As a member of the Avian Power Line Interaction Committee (APLIC), we work alongside industry colleagues to develop best practices to prevent avian collisions with power lines. For over 20 years, OG&E has been an award recipient of Tree Line USA recognition from the Arbor Day Foundation. Although it's not a requirement to maintain Tree Line USA status, we participate in the Energy-Saving Trees program and give several thousand trees to our customers in the spring and fall.</p>

C15.2

(C15.2) Has your organization made a public commitment and/or endorsed any initiatives related to biodiversity?

	Indicate whether your organization made a public commitment or endorsed any initiatives related to biodiversity	Initiatives endorsed
Row 1	Yes, we have endorsed initiatives only	<p>Other, please specify</p> <p>At OGE, we've spent years working on biodiversity-related initiatives to protect our precious ecosystems. Our recent accomplishments include preserving and expanding habitats for endangered species of concern and jumpstarting cleanup projects.</p>

C15.3

(C15.3) Does your organization assess the impacts and dependencies of its value chain on biodiversity?

Impacts on biodiversity

Indicate whether your organization undertakes this type of assessment

Yes

Value chain stage(s) covered

Upstream

Tools and methods to assess impacts and/or dependencies on biodiversity

Dependencies on biodiversity

Indicate whether your organization undertakes this type of assessment

No and we don't plan to within the next two years

C15.4

(C15.4) Does your organization have activities located in or near to biodiversity- sensitive areas in the reporting year?

Not assessed

C15.5

(C15.5) What actions has your organization taken in the reporting year to progress your biodiversity-related commitments?

	Have you taken any actions in the reporting period to progress your biodiversity-related commitments?	Type of action taken to progress biodiversity- related commitments
Row 1	Yes, we are taking actions to progress our biodiversity-related commitments	Other, please specify We partnered with the Oklahoma Frosted Elfin Survey Team to conduct a species survey of the frosted elfin at the Davis solar farm. aiding in efforts to reverse its decline. OGE gave pollinator seed kits for communities to plant pollinator gardens.

C15.6

(C15.6) Does your organization use biodiversity indicators to monitor performance across its activities?

	Does your organization use indicators to monitor biodiversity performance?	Indicators used to monitor biodiversity performance
Row 1		Other, please specify

C15.7

(C15.7) Have you published information about your organization's response to biodiversity-related issues for this reporting year in places other than in your CDP response? If so, please attach the publication(s).

C16. Signoff

C-FI

(C-FI) Use this field to provide any additional information or context that you feel is relevant to your organization's response. Please note that this field is optional and is not scored.

Regarding Targets Abs 1 and Abs 2 in C4.1a, base year emissions for the target are carbon dioxide emissions (i.e., not CO2e) from the fleet of generating units under OG&E's operational control in 2005, plus the emissions from the River Valley and Frontier power plants which were acquired in 2018. Although not owned by OGE in 2005, the plants were operational and emissions were measured. Therefore, emissions from the acquired facilities were included in the 2005 fleet baseline in order to make for a complete comparison with today's fleet which now includes these facilities. This fleet of generating units are expected to be the primary sources of emissions reductions toward meeting the Abs 1 and Abs 2 targets.
